MobiCloud

Power of Clouds in Your Pocket: An Efficient Approach for Cloud Mobile Hybrid Application Development

Ashwin Manjunatha, Ajith H. Ranabahu, Amit Sheth, Krishnaprasad Thirunarayan

Kno.e.sis Center
Wright State University
Agenda

• What are Cloud-Mobile hybrids?
  – Why are they hard to build?
• Building Cloud-Mobile hybrids with DSLs
  – Pros and cons
  – Current DSL
• MobiCloud Toolkit
  – Ongoing work
  – Future work
• Questions
What are Cloud-Mobile Hybrids?
Spectrum of Computing Power

Portability

Scalable
On-demand
Economical

Computing Power

Portable
Ubiquitous
Connected
• Applications that span over multiple devices
  – Back-end in Cloud
  – Front-end in a mobile device
• Both components needed for the app to function
• Front-end is not just a webpage!
  – A native Iphone / Android / Blackberry app
Simple Example

• The Facebook App
  – The Facebook client you have in your smart phone!
    • Mobile front-end for Facebook
      – Most Facebook activity happens via Mobile devices!
  • Many actions need extensive processing in the Facebook backend
  • Both parts (back-end and the front-end) required for the complete experience
Another Research Oriented Example

• Privacy score\(^1\)
  – Introduced by IBM researchers
  – Measures relative exposure of private data on a social network
  – Provides a similar number to “credit score”
• Requires heavy calculations in the back-end
• Front-end is simply one number!
  – Perfect for a mobile device!

1. A Framework for Computing the Privacy Scores of Users in Online Social Networks, Kun Liu, Evimaria Terzi, Ninth IEEE International Conference on Data Mining, 2009
Are CMH Apps hard to build?

- Yes - very much!!

- Clouds are heterogeneous
  - Write the back-end to suit Amazon – You can’t move to Google!!

- Same in mobile devices
  - Need to write different apps for different devices!
    - Android / Iphone / Blackberry are all different
Our solution to this Problem...
Use a DSL

- DSL?
  - Domain Specific Language
  - A mini language for a special purpose
    - Make / Ant
    - Matlab
    - Many other examples

- Use a DSL to **generate** an application
What changes by using a DSL?

• Reduce Complexity
  – As DSLs are designed for specific domain, they reduce complexity!

• Increases Flexibility and avoids vendor lock-in
  – Use single DSL to design applications with different combinations of Cloud and mobile platforms
  – Generate apps for Amazon, Google, Android, Blackberry using just a single script

• Ease of use
  – No separation between front-end / back-end
  – No service interfaces to worry about (auto generated)
  – Communication interfaces are a major source of errors and incompatibilities
A birds-eye view of what we do

DSL Script

Compiler/Generator

Cloud Mobile

Hybrid Application

[Diagram showing the flow from DSL Script to Compiler/Generator to Hybrid Application]
Is this the silver bullet?

• Nope!
  – Less control over the code
    • E.g. Extensive GUI customization and device integration not possible
  – Covers only the 80% case
    • E.g. Not suitable for games or other UI intensive applications
Our current DSL
DSL design principle

• Based on Model-View-Controller (MVC) design pattern
A very simple “Hello World”

recipe :helloworld do
  metadata :id => 'helloworld-app'
  # models
  model :greeting, {:message => :string}
  # controllers
  controller :sayhello do
    action :retrieve,:greeting
  end
  # views
  view :show_greeting,
  {:models =>[:greeting],
   :controller => :sayhello, :action => :retrieve}
end

Metadata – details that need to be attached to the whole application

Models

Controllers

Views
A slightly complicated Example (task manger)

recipe(:todolist) do

  # specific metadata for this app
  metadata({:id => 'todo-list'})

  model(:todoitem, {:name => :string, :description => :string, :time => :string, :location => :string})
  model(:user, {:name => :string, :bday => :string})

  # controllers
  controller(:todohandler) do
    action :create, :todoitem
    action :retrieve, :todoitem
    action :update, :todoitem
    action :delete, :todoitem
  end

  # views
  view :todo_add, {:models => [:todoitem], :controller => :todohandler, :action => :create}
  view :todo_show, {:models => [:todoitem], :controller => :todohandler, :action => :retrieve}

end
Regular Development

- Developed as two applications
- Different platforms need new effort.
- Significant effort in creating code and other artifacts
- Highly customizable

DSL based Development

- Developed as a single application
- Generators create functionally equivalent applications for multiple platforms
- Minimum effort in creating all required artifacts
- Limited customization
Other Benefits of DSL Based Development

• Convenient integration of other features
  – Location based services
    • Integration with available location sensors, e.g. GPS
  – Non functional features
    • Security
  – Social Network features
    • Publish to Facebook, Twitter etc
MobiCloud Online Toolkit – Step 1

Create Your Application

Describe your application using our simple Domain Specific Language (DSL). You can modify one of the existing sample applications or just start from scratch. Don’t forget to take a look at the tutorials.

Populate with todolist sample ▼ Go

```plaintext
recipe(todolist) do
  # specific metadata for this app
  metadata(id: 'mswin-app')
  # model
  model[todotitem, {name: string, description -> string, time -> string, location -> string}]
  model[todotitem, {name: string, id: string, location -> string}]
  # controllers
  controller(todohandler) do
    action: create, todotitem
    action: retrieve, todotitem
    action: update, todotitem
    action: delete, todotitem
```

Select the Targets

- Android 1.5 based application
- Google App Engine: A Java Google Appengine application that can be deployed via the Appengine SDK
- Blackberry: Blackberry application compatible with all blackberry devices
- Amazon EC2: Tomcat based Java Application to host in Amazon EC2 or your local server

Next step
MobiCloud Online Toolkit – Step3

Download your code
You can download the generated code and start customizing it right away or deploy the basic version.

- todolist_blackberry.zip
- todolist_android.zip
- todolist_gae.zip
- todolist_ec2.zip
